

The 27 Most-Used Things In A Science Classroom

After reading this Special Report you will enjoy having a well-stocked science classroom. What exactly is a well-stocked science classroom? Yes, there are test tubes and beakers, but those are not used that often. What if we asked in terms of what is used *most often*? What would the list look like then? That's what follows in the list I've put together here for you.

Warning: Having these items will make you very popular with your colleagues, as you can now come to the rescue whenever they need just about anything. Put your name on *everything*, using item #5- black marker- so it all gets returned.

1. Clear plastic containers

If your students ever handle materials, these are a must. Colored pencils, beakers, and calculators can now be distributed with ease. Save valuable class time by setting them out with materials already in them. This also makes students responsible for their materials. Number the boxes so it's clear who takes what box.

2. Pennies

Keep 100 pennies around, and over the course of a school year you will have used them at least 5 times for something. Flip them when you need 50/50 odds, use them as weights to hold things down, and perform chemical reactions like putting salt and vinegar on them.

3. Calculators

Are you under orders to do as much math as possible? Having a class set of cheap calculators gives you the freedom to do that occasional lesson that you could not have done without them.
